1. Appendix

Table A1. Descriptive statistics for raw binding scores and residual binding scores. Raw scores were computed by subtracting the actual interval length from the corresponding interval estimate (i.e., negative numbers indicate an underestimation of the interval), whereas the residuals were computed by removing the linear influence of interval length on binding scores via participant-wise regression analyses.

		Experiment 1		Experiment 2		
Measure	Judge	L-ATI	F-TAI	L-ATI	F-TAI	F-ATI
Raw Scores	Leader	-74	-24	-50	-47	-31
	Follower	-56	-9	-28	-8	-31
Residuals	Leader	-27	9	-11	-19	2
	Follower	-8	25	7	15	6

L-ATI = leader's action-tone-interval, F-TAI = follower's tone-action interval, F-ATI = follower's action-tone-interval
